General:

The purpose of this report is to show compliance to the FCC regulations for licensed devices operating under section 90 of the Code of Federal Regulations title 47.

This report informs about the results of the RF tests, it only refers to the equipment under test. No part of this report may be reproduced in any form, without written permission.

1 Test Results Summary

Name of Test	FCC Para. No.	FCC Method	FCC Spec.	Result
RF Power Output	90.635	2.1046	1000 Watts	Complies
Occupied Bandwidth	90.210	2.1049	Input/Output	Complies
Spurious Emissions at Antenna Terminals	90.210	2.1051	-13dBm	Complies
Intermodulation testing	90.219	KDB 935210 D02 v02 Annex D.3	-13dBm	Complies
Emission Mask	90.691	2.1051	-13dBm	Complies
Frequency Stability	90.213	2.1055	1 ppm	NA
Out of Band Rejection	KDB 935210 D02 v02	KDB 935210 D03 v02	KDB 935210 D03 v02	Complies
Noise	90.219			Complies
Radiated Spurious emission	90.210	2.1053	-13dBm	Complies

Frequency stability is given by: The system gets an electrical analog signal from the BSS which is converted into an analog optical signal, transmitted by the optical links and then reconverted in the Remote Unit into an analog electrical signal. During this process happens no frequency change/modification, so input and output have same frequency what can be seen under clause "Occupied Bandwidth".

2 Equipment under test (E.U.T.)

2.1 Description

Kind of equipment	ION-U EU H 7P/80-85P/17P/19P-Vac-M2	
Andrew Ident. Number	7698401-0001	
Serial no.(SN)	11	
Revision	00	
Software version and ID	1.69.0	
Type of modulation and Designator	GSM (GXW)	<input checked="" type="checkbox"/>
	GSM EDGE (G7W)	<input checked="" type="checkbox"/>
	CDMA (F9W)	<input checked="" type="checkbox"/>
	W-CDMA (F9W)	<input checked="" type="checkbox"/>
	LTE (G7D)	<input checked="" type="checkbox"/>
Frequency Translation	F1-F1	<input checked="" type="checkbox"/>
	F1-F2	<input type="checkbox"/>
	N/A	<input type="checkbox"/>
Band Selection	Software	<input type="checkbox"/>
	Duplexer	<input checked="" type="checkbox"/>
	Full band	<input type="checkbox"/>

2.1.1 Downlink

Pass band	Path 862 MHz – 894 MHz
Pass band under test	Path 862 MHz – 869 MHz
Max. composite output power based on one carrier per path (rated)	43.0 dBm = 20 W
MIMO max. composite output power based on one carrier per path (rated)	46.0 dBm = 40 W
System Gain*	10 dB @ Pout BTS of 33 dBm

*see 2.1.5

2.1.2 Uplink

Pass band	Path 817 MHz – 849 MHz
Maximum rated output power	n. a.
System Gain*	n.a.

*see 2.1.5

Note: The EUT does not transmit over the air in the uplink direction.

BUREAU
VERITAS

2.1.3 Description of EUT

CommScope's ION-U EU H 7P/80-85P/17P/19P-Vac-M2 is a multi-band, multi-operator extension unit for MIMO application in all RF paths. It is used in conjunction with the main unit ION-U H 7P/80-85P/17P/19P-Vac-M2. This extension transports up to four frequency bands simultaneously, providing a cost-effective solution for distributing capacity from one or more base stations.

This Test Report describes only the approval of the 850 MHz Path.

The ION-U EU H 7P/80-85P/17P/19P-Vac-M2 Repeater system consists of one 700 MHz path, one 800-850 MHz path, one 1700/2100 MHz path and one 1900 MHz path with the intended use of simultaneous transmission.

The antenna(s) used with device must be fixed-mounted on permanent structures.

2.1.4 Block diagram of measurement reference points

figure 2.1.4-#1 Block diagram of measurement reference points

Extension Unit 1 (EU1) is the EUT

O/E Optical / Electrical converter
 MU Master Unit

Reference point A	MU	UL output,	DL input
Reference point B	Extension Unit	DL output,	UL input
Reference point Z	BTS	DL output,	UL input

Since a signal generator does not supply a good output signal with +33 or +43dBm, for the downlink measurement the MU Attenuation is not used.

That means for downlink measurements the signal generator is connected to measurement point A at the master optical / electrical converter and the analyzer to the measurement point B at the EU.

2.1.5 Downlink System Gain and Output Power

System optimized for BTS power (<i>fixed value</i>)	MU Attenuation (<i>manual leveling</i>)	Maximum rated input power at the MU OTRX (<i>fixed value</i>)	EU Gain (<i>fixed value</i>)	Maximum rated output power at EU Antenna port (<i>fixed value</i>)
Z		A	A to B	B
+33 dBm	55 dB	-22 dBm	+65 dB	+43.0 dBm @ 1 carrier
System Gain Z to B	+10 dB			
+43 dBm	65 dB	-22 dBm	+65 dB	+43.0 dBm @ 1 carrier
System Gain Z to B	+0 dB			

table 2.1.5-#1 Equipment under test (E.U.T.) Description Downlink System Gain and Output Power

**BUREAU
VERITAS**

3.3 Input and output losses

All recorded power levels should be referenced to the input and output connectors of the repeater, unless explicitly stated otherwise.

The test equipment used in this test has to be calibrated, so that the functionality is also checked.

All cables, attenuators, splitter, isolator, circulator and combiner etc. must be measured before testing and used for compensation during testing.

3.4 Measurement uncertainty

The extended measurement uncertainty corresponds to the measurement results from the standard measurement uncertainty multiplied by the coverage factor k=2. The true value is located in the corresponding interval with a probability of 95 %.

4 Test site (Bureau Veritas Consumer Products Services)

FCC Test site: 96997

See relevant dates under section 8.

5 RF Power Out: §90.635, §2.1046

figure 5-#1 Test setup: RF Power Out: §90.635, §2.1046

Measurement uncertainty	$\pm 0,38 \text{ dB}$
Test equipment used	9069, 9046, 9236, 7406, 7157, 7158, 7289, 7290, 7385

5.1 Limit

Minimum standard:

§ 90.635 Limitations on power and antenna height.

(a) The effective radiated power and antenna height for base stations may not exceed 1 kilowatt (30 dBW) and 304 m. (1,000 ft.) above average terrain (AAT), respectively, or the equivalent thereof as determined from the Table. These are maximum values, and applicants will be required to justify power levels and antenna heights requested.

5.2 Test method

§ 2.1046 Measurements required: RF power output.

(a) For transmitters other than single sideband, independent sideband and controlled carrier radiotelephone, power output shall be measured at the RF output terminals when the transmitter is adjusted in accordance with the tune-up procedure to give the values of current and voltage on the circuit elements specified in § 2.1033(c)(8). The electrical characteristics of the radio frequency load attached to the output terminals when this test is made shall be stated.

(c) For measurements conducted pursuant to paragraphs (a) and (b) of this section, all calculations and methods used by the applicant for determining carrier power or peak envelope power, as appropriate, on the basis of measured power in the radio frequency load attached to the transmitter output terminals shall be shown. Under the testconditions specified, no components of the emission spectrum shall exceed the limits specified in the applicable rule parts as necessary for meeting occupied bandwidth or emission limitations

5.3 Test Results

Detector RMS.

Test signal GSM:

Signal waveform with GMSK modulation in all time slots according to 3GPP TS45.004

Test signal GSM EDGE:

Signal waveform with 8-PSK modulation in all time slots according to 3GPP TS45.004

Test signal CDMA:

Signal waveform according to table 6.2-1 of standard specification 3GPP2 C.p0051-0 v1.0 16.February 2006 pilot, sync, paging, 37 traffics, which is equal to the table 6.5.2.1 of 3GPP2 C.S0010-C v2.0 24.February 2006.

Test signal WCDMA:

Signal waveform according to Test Model 1 of standard specification 3GPP TS25.141. Signal modulated with a combination of PCCPCH, SCCPCH and Dedicated Physical Channels specified as test model 1 64 DPCH.

Test signal LTE:

Signal waveform according to Test Model 1.1, E-TM1.1, clause 6.1.1.1-1, table 6.1.1.1-1 of standard specification 3GPP TS 36.141 V9.3.0 (2010-03).

5.3.1 Downlink

Modulation	Measured at	Carrier /MHz	RBW VBW Span	RF Power (dBm)	RF Power (W)	MIMO* RF Power (W)	Plot -
GSM	Middle	865.5 MHz	1MHz 3MHz 10MHz	43.0	20	40	5.3.1.1 #1
EDGE	Middle	865.5 MHz	1MHz 3MHz 10MHz	43.0	20	40	5.3.1.2 #1
CDMA	Middle	865.5 MHz	3MHz 10MHz 15MHz	43.0	20	40	5.3.1.3 #1
WCDMA	Middle	865.5 MHz	10MHz 10MHz 50MHz	43.0	20	40	5.3.1.4 #1
LTE	Middle	865.5 MHz	3MHz 10MHz 15MHz	43.0	20	40	5.3.1.5 #1
Maximum output power = 43.0 dBm = 20 W							
Limit Maximum output power (erp) = 1000 W							

table 5.3.1-#1 RF Power Out: §90.635, §2.1046 Test Results Downlink

SISO:

The max RF Power out is 43 dBm, so the maximum antenna gain (x) can be calculated as follow:

$$\text{Limit} = 1000\text{W (erp)} = \mathbf{60 \text{ dBm}}$$

$$\text{Info: } 1000\text{W (erp)} = 1640\text{W (eirp)}$$

$$60 \text{ dBm} > 43 \text{ dBm} + x \quad \rightarrow \quad x = 60 \text{ dBm} - 43 \text{ dBm} = \mathbf{17 \text{ dBd}} \\ x \text{ dBi} = 17 \text{ dBd} + 2.15 = \mathbf{19.15 \text{ dBi}}$$

=> The antenna that will be used for the complete system have to have a gain lower than 19.15 dBi, relative to a dipole.

***MIMO:**

MIMO path test results see RF Test Report FCC ID XS5-UH781719P.

If the DUT used in MIMO configuration according to KDB 662911, the MIMO Max RF Power is the sum of the RF power from the SISO path and MIMO path.

$$\mathbf{\text{MIMO Max RF Power} = SISO \text{ path RF Power} + MIMO \text{ path RF Power}}$$

$$\mathbf{\text{MIMO Max RF Power} = 20 \text{ W} + 20 \text{ W} = 40 \text{ W} = 46 \text{ dBm}}$$

The MIMO max RF Power out is 46 dBm, so the maximum antenna gain (x) can be calculated as follow:

Limit = 1000W (erp) = 60 dBm

Info: 1000W (erp) = 1640W (eirp)

$$60 \text{ dBm} > 46 \text{ dBm} + x \quad \text{---->} \quad x = 60 \text{ dBm} - 46 \text{ dBm} = \underline{14 \text{ dBd}}$$

$$x \text{ dBi} = 14 \text{ dBd} + 2.15 = \underline{16.15 \text{ dBi}}$$

=> The antenna that will be used for the complete system have to have a gain lower than 16.15 dBi, relative to a dipol.

Modulation	Pin / dBm (Ref. point B)
GSM	-22.3
EDGE	-22.3
CDMA	-21.9
WCDMA	-21.8
LTE	-22.2

5.4 Summary test result

Test result	complies, according the plots above
Tested by:	F. Bengesser
Date:	22.12.2014

6 Occupied Bandwidth: §90.210, §2.1049

External Attenuator DL $x \text{ dB} = 20 \text{ dB}$

figure 6-#1 Test setup: Occupied Bandwidth: §90.210, §2.1049

Measurement uncertainty	$\pm 0,38 \text{ dB}$
Test equipment used	9069, 9046, 9236, 7406, 7157, 7158, 7289, 7290, 7385

6.1 Limit

The spectral shape of the output should look similar to input for all modulations.

6.2 Test method

Para. No.2.1049

The occupied bandwidth, that is the frequency bandwidth such that, below its lower and above its upper frequency limits, the mean powers radiated are each equal to 0.5 percent of the total mean power radiated by a given emission shall be measured under the following conditions as applicable:

Test equipment used	9069, 9046, 9236, 7406, 7157, 7158, 7289, 7290, 7385	

7.1 Limit

MASK	Spurious Limit
A,B,C,G,H,I	-13dBm

7.2 Test method

Para. No 2.1051 Measurements required: Spurious emissions at antenna terminals.

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

9.1 Limit

§90.691 Emission mask requirements for EA-based systems.

(a) Out-of-band emission requirement shall apply only to the "outer" channels included in an EA license and to spectrum adjacent to interior channels used by incumbent licensees. The emission limits are as follows:

(1) For any frequency removed from the EA licensee's frequency block by up to and including 37.5 kHz, the power of any emission shall be attenuated below the transmitter power (P) in watts by at least $116 - \text{Log}_{10}(f/6.1)$ decibels or $50 + 10 \text{ Log}_{10}(P)$ decibels or 80 decibels, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kilohertz and where f is greater than 12.5 kHz.

(2) For any frequency removed from the EA licensee's frequency block greater than 37.5 kHz, the power of any emission shall be attenuated below the transmitter power (P) in watts by at least $43 + 10\text{Log}_{10}(P)$ decibels or 80 decibels, whichever is the lesser attenuation, where f is the frequency removed from the center of the outer channel in the block in kilohertz and where f is greater than 37.5 kHz.

(b) When an emission outside of the authorized bandwidth causes harmful interference, the Commission may, at its discretion, require greater attenuation than specified in this section.

9.2 Test method

Para. No 2.1051 Measurements required: Spurious emissions at antenna terminals.

The radio frequency voltage or powers generated within the equipment and appearing on a spurious frequency shall be checked at the equipment output terminals when properly loaded with a suitable artificial antenna. Curves or equivalent data shall show the magnitude of each harmonic and other spurious emission that can be detected when the equipment is operated under the conditions specified in § 2.1049 as appropriate. The magnitude of spurious emissions which are attenuated more than 20 dB below the permissible value need not be specified.

12 Field Strength of Spurious Emissions: §90.210, §2.1053

The frequency bands of the extension unit will be implemented on the master unit with a compensation frequency bands.

About the optical fiber all frequencies will be forwarded to the RU.

At the RU the optical signals will be converted into RF signals.

The frequency bands, which were not changed will be filtered by the duplexer, then amplified and transmitted by the RU.

The replaced frequency bands filtered out and forwarded via the Cable Bridge to the EU. These frequencies converted back by the conversion module (FCM) to their original frequencies band and then they were amplified and sent out.

The worst case mode for the radiated emission is the MIMO mode. Both devices are operated with the maximum power, at the same time.

BUREAU
VERITAS

12.1 Limit §22.917

The rules in this section govern the spectral characteristics of emissions in the Broadband Personal Communications Service.

(a) *Out of band emissions.* The power of any emission outside of the authorized operating frequency ranges must be attenuated below the transmitting power (P) by a factor of at least $43 + 10 \log(P)$ dB.

(b) *Measurement procedure.* Compliance with these rules is based on the use of measurement instrumentation employing a resolution bandwidth of 1 MHz or greater. However, in the 1 MHz bands immediately outside and adjacent to the frequency block a resolution bandwidth of at least one percent of the emission bandwidth of the fundamental emission of the transmitter may be employed. A narrower resolution bandwidth is permitted in all cases to improve measurement accuracy provided the measured power is integrated over the full required measurement bandwidth (*i.e.* 1 MHz or 1 percent of emission bandwidth, as specified). The emission bandwidth is defined as the width of the signal between two points, one below the carrier center frequency and one above the carrier center frequency, outside of which all emissions are attenuated at least 26 dB below the transmitter power.

The emission measurements have been made with transmission at **Bottom/Middle/Top frequency (869MHz/881.5MHz/894MHz)**

The limit is -13dBm (e.i.r.p).

12.2 Test method ANSI/TIA/EA-603-C

Measurement procedure. TIA-603-C

The antenna substitution method is used to determine the equivalent radiated power at spurious frequencies. The spurious emissions are measured at a distance of 3 meters. The EUT is then replaced with a reference substitution antenna with a known gain referenced to a dipole. This antenna is fed with a signal at the spurious frequency. The level of the signal is adjusted to repeat the previously measured level. The resulting eirp is the signal level fed to the reference antenna corrected for gain referenced to an isotropic dipole (see Figure 7.2).

From KDB (AMPLIFIER, BOOSTER, AND REPEATER REMINDER SHEET):

Radiated spurs (enclosure) – Use of CW signal (low, mid. and high freq.) is acceptable rather than all modulations.

The maximum RFI field strength was determined during the measurement by rotating the turntable (± 180 degrees) and varying the height of the receive antenna ($h = 1 \dots 4$ m) as like defined in ANSI C63.4. A measurement receiver has been used with a RBW 120 kHz up to 1 GHz and 1 MHz above 1 GHz. Steps with during pre measurement was half the RBW.

Both, the Fully Anechoic Chamber (FAC) and the Semi Anechoic Chamber (SAC) fulfil the requirements of ANSI C63.4 and CISPR 16-1-4 with regards to NSA and SVSWR.
